

EJO LABS

PRACTICAL AI FOR RWANDA & AFRICA

AI Services That Move **Rwanda** **Forward.**

A Capabilities Overview for Partners & Clients

KINYARWANDA-FIRST AI

Built for Rwandan speech, not
translated from English

PRODUCTION-READY

Fully deployed systems, not
unscalable prototypes

AGENTIC REASONING

Autonomous AI agents that reason,
act, and report

WHO WE ARE

Ejo Labs builds AI systems that speak Kinyarwanda and understand Rwanda. We combine large language models, computer vision, and agentic pipelines with deep local knowledge to deliver production-ready solutions for Rwandan organisations. We build AI for low-resource languages like Kinyarwanda — where big tech isn't looking.

OUR SERVICES

01 EjoChat — Kinyarwanda AI Assistant

Rwanda's first production-ready Kinyarwanda conversational AI

EjoChat is fine-tuned on curated Rwandan language data to understand natural Kinyarwanda — informal speech, idioms, and local context. Integrate via REST API into citizen portals, mobile apps, USSD, or WhatsApp.

- ▶ Kinyarwanda-first, multilingual fallback, domain-tunable
- ▶ REST API for web, mobile, USSD & WhatsApp
- ▶ Ideal for: citizen services, NGO outreach, enterprise helpdesks

02 Agentic AI, RAG & Computer Vision

Intelligent agents that retrieve, reason, act — and see

RAG agents ingest your documents and data feeds, reason over them, and produce structured outputs. For security, this extends to AI-powered video surveillance with real-time object detection and anomaly alerts — powered by Qdrant vector search.

- ▶ Document RAG: PDFs, databases → cited, structured answers
- ▶ Video surveillance: object detection, person ID, anomaly alerts
- ▶ Image analysis: scene classification, evidence documentation

OUR SERVICES

03

AI Consultancy — We Solve Your Problem

Understanding your world before we build for it

Before any technology, we sit with your team to understand what you do, where friction is, and where AI can create the most value. Then we design and build the right solution — whether that's a custom model, a data pipeline, or an agentic system.

- ▶ Workshop: map your operations, data, and pain points
- ▶ Use-case identification: highest-impact, lowest-risk opportunities
- ▶ Bespoke AI solution design and delivery

How a Discovery Session Works

We meet your team, map your workflows, audit your data, and identify where AI can act now. No jargon, completely exploratory — just a clear picture of what's possible and a concrete proposal if you choose to proceed.

- ▶ Workflow mapping: where time is lost, errors occur, or data sits unused
- ▶ Data audit: what you already have that AI can act on immediately
- ▶ Use-case prioritisation: highest-impact, lowest-risk starting points
- ▶ Feasibility & cost estimate: realistic timelines and investment
